

Research Method	Key Finding	Supporting Evidence	Strength of Evidence	Product Design Implication
User Research	Users lacked confidence and wanted personalized career guidance rather than generic recommendations.	Interviews and survey responses identified uncertainty, information overload, and a desire for personalized support.	High	Prioritize personalized recommendations, career guidance, and confidence-building features.
Emotional Pattern Analysis	Career exploration is strongly influenced by users' emotions, particularly uncertainty and anxiety.	Self-reported emotions consistently identified confusion, frustration, and the need for reassurance.	Moderate	Design the experience to reduce anxiety and promote clarity, confidence, and empowerment.
Personas	Different users share similar emotional needs but require personalized experiences.	Personas synthesized recurring goals, frustrations, motivations, and behaviors from user research.	Moderate	Support personalization through tailored recommendations and progressive profiling.
Emotional Journey	Existing career exploration tools create emotional highs and lows throughout the decision-making process.	Journey mapping highlighted recurring pain points while using career assessments and research tools.	Moderate	Provide guidance and support at key moments to reduce uncertainty throughout the user journey.
User Perception Testing	Users perceived Vocari as engaging and valuable but wanted clearer explanations behind recommendations.	ESPS responses indicated positive perceptions while identifying opportunities for improved transparency.	High	Improve recommendation explanations and communicate why careers are suggested.
Experience Testing	Users successfully completed tasks but desired additional emotional support and guidance.	Usability observations and participant feedback identified opportunities to improve onboarding and confidence-building.	High	Enhance onboarding, supportive messaging, and guided career exploration.
Physiological Testing	Users remained engaged even when facial expressions appeared neutral.	MorphCast attention data and heart-rate monitoring demonstrated sustained engagement during reflective tasks.	Moderate	Continue emphasizing reflective activities and interpret physiological data alongside other UX methods.
Behavioral Measurement	User behavior confirmed areas where participants hesitated or required additional guidance.	Navigation patterns, task completion, scrolling behavior, and observations identified usability opportunities.	High	Simplify navigation, improve clarity, and validate design decisions using observed behavior.
